Note In some cases, searching for a plug-in site's name might result in a blank search result. Check the Internet Explorer history and cache to see if the site has recently been visited and refresh your browser to see if the site's name changed. ## Getting the Plug-in Plug-ins are small applications that complement and enhance the functionality of Photoshop with additional features. In some cases, plug-ins work better or simply enhance a feature Photoshop doesn't have. In each case, you can download plug-ins from Adobe's website or from third-party sites like Macromedia or Macromedia's Flash plug-in site at ``. ## Installing the Plug-in After you locate the Plug-in site, browse through the plug-ins for the software you plan to use and check out the features. Browse through the main categories in the \_Adobe Plugin Plugin\_ menu (Figure 4-1) to find a suitable plug-in. Figure 4-1. The Adobe Plugin Plugin menu gives you quick access to your plug-in collection. If you find a plug-in with features you need, select it from the menu and use the following options to install it. \* \*\*Where to install:\*\* Click the Install button, and then locate the plug-in in your Photoshop File System (or just drag the plug-in over to the Plug-ins window; see Figure 4-2). Figure 4-2. It's easiest to move your plug-ins into the Plug-ins window. Note that Photoshop suggests that you install the plug-in \_only when Photoshop is not running\_, even though it's an action that you can run with any image open in Photoshop. This feature prevents you from installing a plug-in only to find that you can't apply it until you close Photoshop. If you know you plan to use the plug-in, you can click OK to install the plug-in.

Q: Bridging (mesos/docker/kubernetes/zookeeper/...) on AWS I am trying to deploy a Mesos cluster on AWS. Currently, I can follow this tutorial: But it doesn't work very well because I cannot get a Zookeeper service working. And I don't find any documentation how to run Mesos / Docker / Kubernetes or whatever on AWS without a central server. Is there any tutorial, example or just a hint how to do this properly? A: If you want to host your container-based services on AWS, you need to run them on the EC2 instance instances. The tutorial you're referring to talks about a central server based on Apache Mesos, but it can also be running on an EC2 instance. If you want a Mesos cluster (as you mentioned in your question), you should use Marathon instead of Mesos. Marathon is a simple wrapper for Mesos and can run in an EC2 instance. There is a tutorial for Marathon, but it is a bit old, so I'll try to help you with a new one. As for Zookeeper, you can have several instances of it running on EC2, or maybe just one, in which case the configuration you're using should work. I didn't check the tutorial you linked, so it's possible that there is a problem in the Zookeeper configuration you're using, but this tutorial explains how you can deploy it in AWS and provides its configuration. # frozen\_string\_literal: true module RailsAdmin module Models module Admin module Types class Table
